

Lab: Intro and Basic Syntax

Problems for in-class lab for the ["C# Fundamentals" course @ SoftUni](#)

You can check your solutions in [Judge](#)

1. Student Information

You will be given 3 lines of input – student name, age and average grade. Your task is to print all the info about the student in the following format: "Name: {student name}, Age: {student age}, Grade: {student grade}".

Examples

Input	Output
John 15 5.40	Name: John, Age: 15, Grade: 5.40
Steve 16 2.50	Name: Steve, Age: 16, Grade: 2.50
Marry 12 6.00	Name: Marry, Age: 12, Grade: 6.00

2. Passed

Write a program, which takes as an input a **grade** and prints "**Passed!**" if the grade is **equal or more than 3.00**.

Input

The **input** comes as a single floating-point number.

Output

The **output** is either "**Passed!**" if the grade is **equal or more than 3.00**, otherwise you should print nothing.

Examples

Input	Output	Input	Output
5.32	Passed!	2.34	(no output)

Solution

We need to take as an input a floating-point number from the console. We will use **double.Parse()** to convert **string** to **double**, which we receive from **Console.ReadLine()**. After that we compare the grade with **3.00** and prints the result **only if** the condition returns **true**.

```
var grade = double.Parse(Console.ReadLine())
if (grade >= 3.00)
{
    Console.WriteLine("Passed!");
}
```

3. Passed or Failed

Modify the above program, so it will print "**Failed!**" if the grade is **lower than 3.00**.

Input

The **input** comes as a single double number.

Output

The **output** is either "**Passed!**" if the grade is **more than 2.99**, otherwise you should print "**Failed!**".

Examples

Input	Output	Input	Output
5.32	Passed!	2.36	Failed!

Solution

Again, we need to take **floating-point** number from the console. After that print in the **else** statement the appropriate message.

```
var grade = double.Parse(Console.ReadLine());
if (grade >= 3.00)
{
    Console.WriteLine("Passed!");
}
else
{
    Console.WriteLine("Failed!");
}
```

4. Back in 30 Minutes

Every time Stamat tries to pay his bills he sees on the cash desk the sign: "**I will be back in 30 minutes**". One day Stamat was sick of waiting and decided he needs a program, which **prints the time after 30 minutes**. That way he won't have to wait on the desk and come at the appropriate time. He gave the assignment to you, so you have to do it.

Input

The **input** will be on two lines. On the **first line**, you will receive the **hours** and on the **second** you will receive the **minutes**.

Output

Print on the console the time after **30 minutes**. The result should be in format **hh:mm**. The **hours** have **one or two numbers** and the **minutes** have always **two numbers (with leading zero)**.

Constraints

- The **hours** will be between **0 and 23**.
- The **minutes** will be between **0 and 59**.

Examples

Input	Output
1 46	2:16

Input	Output
0 01	0:31

Input	Output
23 59	0:29

Input	Output
11 08	11:38

Input	Output
11 32	12:02

Hints

- Add 30 minutes to the initial minutes, which you receive from the console. If the minutes are more than 59 – increase the hours with 1 and decrease the minutes with 60. The same way check if the hours are more than 23. When you print check for leading zero.

5. Month Printer

Write a program, which takes an **integer** from the console and prints the corresponding **month**. If the number is **more than 12** or **less than 1** print "Error!".

Input

You will receive a **single integer** on a **single line**.

Output

If the number is within the boundaries print the corresponding month, otherwise print "Error!".

Examples

Input	Output
2	February

Input	Output
13	Error!

Solution

```
var day =   
switch (day)  
{  
    case 1:  
        Console.WriteLine("January");  
        break;  
    case 2:  
        Console.WriteLine("February");  
        break;  
    // Add the rest of the cases  
    case 12:  
        Console.WriteLine("December");  
        break;  
    default:  
        Console.WriteLine("Error!");  
        break;  
}
```

6. Foreign Languages

Write a program, which prints the language, that a given country speaks. You can receive only the following combinations: English **is spoken** in England and USA; Spanish **is spoken** in Spain, Argentina and Mexico; for the others, we should print "unknown".

Input

You will receive a **single country name** on a **single line**.

Output

Print the **language**, which the country **speaks**, or if it is **unknown** for your program, print **"unknown"**.

Examples

Input	Output	Input	Output
USA	English	Germany	unknown

Hint

Think how you can **merge** multiple cases, in order to **avoid** writing more code than you need to.

7. Theatre Promotions

A theatre **is doing a ticket sale**, but they need a program **to** calculate the price of a single ticket. If the given age does not fit one of the categories, you should print "Error!". You can see the prices in the table below:

Day / Age	0 <= age <= 18	18 < age <= 64	64 < age <= 122
Weekday	12\$	18\$	12\$
Weekend	15\$	20\$	15\$
Holiday	5\$	12\$	10\$

Input

The input comes in **two lines**. On the **first** line, you will receive the **type of day**. On the **second** – the **age** of the person.

Output

Print the price of the ticket according to the table, or **"Error!"** if the age is not in the table.

Constraints

- The age will be in the interval [-1000...1000].
- The type of day will **always be valid**.

Examples

Input	Output	Input	Output	Input	Output	Input	Output
Weekday 42	18\$	Holiday -12	Error!	Holiday 15	5\$	Weekend 122	15\$

Solution

Step 1. Read the Input

We need to read **two** lines. **First** one will be the **type of day**. We will convert it to **lower case** letters with the method `"ToLower()"`. After that, we will read the **age** of the person and declare a **variable – price**, which we will use to set the price of the ticket.

```
var day = Console.ReadLine().ToLower();
var age = int.Parse(Console.ReadLine());
var price = 0;
```

Step 2. Add If-else Statements for the Different Types of Day

For every **type of day**, we will need to add **different cases** to check the **age** of the person and **set the price**. Some of the **age groups** have **equal prices** for the **same type** of day. This means we can use **logical operators** to **merge some of the conditions**.

```
if (day == "weekday")
{
    if ((age >= 0 && age <= 18) || (age > 64 && age <= 122))
    {
        price = 12;
    }
    else if (age > 18 && age <= 64)
    {
        price = 18;
    }
}
// Add the other cases
```

Think **where** and **how** you can use **logical operators** for the **other cases**.

Step 3. Print the Result

We can check if the **price has a value** different, than the **initial** one. If It it does, that means we got a **valid combination of day and age** and the price of the ticket is saved in the **price** variable. If the **price** has a **value of 0**, then none of the cases got hit, therefore we have to **print the error message**.

```
if (price != 0)
{
    Console.WriteLine($"Price = {price}");
}
else
{
    Console.WriteLine("Error!");
}
```

8. Divisible by 3

Write a program, which prints all the numbers from **1 to 100**, which are **divisible by 3**. You have to use a single **for** loop. The program should not receive input.

Solution

```
for (var i = 3; i <= 100; i += 3)
{
    Console.WriteLine(i);
}
```

9. Sum of Odd Numbers

Write a program that prints the next **n odd numbers** (starting from 1) and on the **last row** prints the **sum of them**.

Input

On the first line, you will receive a number – **n**. This number shows how many **odd numbers** you should print.

Output

Print the next **n** odd numbers, starting from **1**, separated by **new lines**. On the last line, print the **sum** of these numbers.

Constraints

- **n** will be in the interval **[1...100]**

Examples

Input	Output	Input	Output
5	1 3 5 7 9 Sum: 25	3	1 3 5 Sum: 9

Solution

```
var n = int.Parse(Console.ReadLine());
var sum = 0;

for (var i = 1; i <= n; i++)
{
    Console.WriteLine(i);
    sum += i;
}

Console.WriteLine($"Sum: {sum}");
```

10. Multiplication Table

You will receive an **integer** as an input from the console. Print the **10 times table** for this integer. See the examples below for more information.

Output

Print every row of the table in the following format:

`{theInteger} X {times} = {product}`

Constraints

- The integer will be in the interval **[1...100]**

Examples

Input	Output	Input	Output
5	5 X 1 = 5 5 X 2 = 10 5 X 3 = 15 5 X 4 = 20 5 X 5 = 25 5 X 6 = 30 5 X 7 = 35 5 X 8 = 40 5 X 9 = 45 5 X 10 = 50	2	2 X 1 = 2 2 X 2 = 4 2 X 3 = 6 2 X 4 = 8 2 X 5 = 10 2 X 6 = 12 2 X 7 = 14 2 X 8 = 16 2 X 9 = 18 2 X 10 = 20

11. Multiplication Table 2.0

Rewrite your program so it can receive the **multiplier from the console**. Print the **table from the given multiplier to 10**. If the given multiplier is **more than 10** - print only one row with the **integer**, the given **multiplier** and the **product**. See the examples below for more information.

Output

Print every row of the table in the following format:

`{theInteger} X {times} = {product}`

Constraints

- The integer will be in the interval **[1...100]**

Examples

Input	Output	Input	Output	Input	Output
5	5 X 1 = 5 5 X 2 = 10 5 X 3 = 15 5 X 4 = 20 5 X 5 = 25 5 X 6 = 30 5 X 7 = 35 5 X 8 = 40	2	2 X 5 = 10 2 X 6 = 12 2 X 7 = 14 2 X 8 = 16 2 X 9 = 18 2 X 10 = 20	2	2 X 14 = 28
1		5		14	

	5 X 9 = 45 5 X 10 = 50
--	---------------------------

--	--

--	--

12. Even Number

Take as an input an even number and **print its absolute value**. If the number is odd, print "Please write an even number." and continue reading numbers.

Examples

Input	Output
1	Please write an even number.
3	Please write an even number.
6	The number is: 6

Input	Output
-6	The number is: 6

13. Debug the Code: Holidays Between Two Dates

You are assigned to **find and fix the bugs** in an existing piece of code, using the Visual Studio **debugger**. You should trace the program execution to find the lines of code that produce incorrect or unexpected results.

You are given a program (existing **source code**) that aims to **count the non-working days between two dates** given in format **day.month.year** (e.g. between **1.05.2015** and **15.05.2015** there are **5** non-working days – Saturday and Sunday).

Examples

Input	Output	Comments
1.05.2016 15.05.2016	5	There are 5 non-working days (Saturday / Sunday) in this period: 1-May-2016, 7-May-2016, 8-May-2016, 14-May-2016, 15-May-2016
1.5.2016 2.5.2016	1	Only 1 non-working day in the specified period: 1.05.2016 (Sunday)
15.5.2020 10.5.2020	0	The second date is before the first. No dates in the range.
22.2.2020 1.3.2020	4	Two Saturdays and Sundays: <ul style="list-style-type: none"> 22.02.2020 and 23.02.2020 29.02.2020 and 1.03.2020

You can **find the broken code** in the judge system: [Broken Code for Refactoring](#). It looks as follows:

HolidaysBetweenTwoDates.cs
<pre>using System; using System.Globalization; class HolidaysBetweenTwoDates { static void Main() { var startDate = DateTime.ParseExact(Console.ReadLine(), "dd.m.yyyy", CultureInfo.InvariantCulture); var endDate = DateTime.ParseExact(Console.ReadLine(),</pre>

```
        "dd.m.yyyy", CultureInfo.InvariantCulture);  
var holidaysCount = 0;  
for (var date = startDate; date <= endDate; date.AddDays(1))  
    if (date.DayOfWeek == DayOfWeek.Saturday &&  
        date.DayOfWeek == DayOfWeek.Sunday) holidaysCount++;  
Console.WriteLine(holidaysCount);  
    }  
}
```

Hints

There are **4 mistakes** in the code. You've got to **use the debugger** to find them and fix them. After you do that, submit your **fixed code in the judge contest**: <https://judge.softuni.bg/Contests/Practice/Index/304#8>.
